

Given erasures of D_2 , D_3 , and C_3 , strike them out from the encoding process.

Substitute survived data chunks D_1 and D_3 into survived parity chunks C_2 and C_3

Using **Two-tone elimination decoding algorithm**, from the leftmost staggered codewords, solve each codeword inward one by one (similar to the case of 3 data chunks erased but only one side here).

Re-encode erased parity chunk C_1 with the same *Shift-NOR* rules
